

DIRECT INTERIOR SOLUTIONS LIMITED

ENERGY & WASTE

With the needs to maintain and diversify Energy Production; meet increasing environmental targets to reduce CO2 emissions and to curb the amount of waste going to landfill, Direct Interior Solutions have undertaken work on two of the UK's most ambitious Energy from Waste projects.

The Ardley EFW project in Oxfordshire is a Joint Venture between Clugston Construction and CNIM. The plant is designed to process 300,000 tonnes of residual waste each year and generate enough electricity to power over 38,000 homes. In doing so, it will divert 95% of Oxfordshire's residual municipal waste from landfill.

Direct Interior Solutions are delighted to have undertaken all internal Joinery within the state-of-the-art Administration and Visitor Centre. With Oak as the primary finish, we have supplied and installed all internal timber products, including fitting out of Kitchens and Changing Rooms, together with the manufacture and installation of acoustic and fire rated timber screens within the facility.

At Basildon in Essex, Direct Interior Solutions have completed extensive work on the new MBT (Mechanical Biological Treatment) facility as part of a Joint Venture between Balfour Beatty and Urbaser. Designed to set new standards in Industrial Architecture, this multi-million pound facility collects and then separates the recyclable wastes. The remainder is then composted inside the building where it is then refined and processed into either stabilised organic material or Solid Recovered Fuel which can be used to generate electricity.

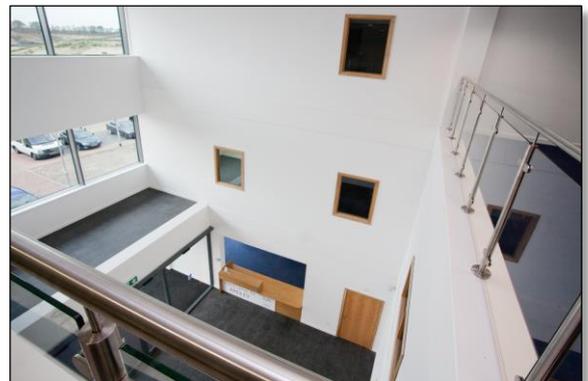

Direct Interior Solutions have provided all internal Joinery within the Administration and Visitors centre, including the manufacture of internal timber screens, together with the supply and installation of GRP roofs to internal plant rooms and finishing works within the Bio Halls.

Ardley EFW nearing completion

Bespoke joinery requirements catered for

Oak window frames in entrance and offices

Installation of cubicles and IPS
